

MAIA

Health AI that answers to you

Patient-controlled records, private AI, and group support.
Free and open source — no company behind it.

The MAIA welcome page — captured from the app

Hosts, groups, and their admins

The three moving parts — and who controls each one

- H One host, yours**
A patient has one MAIA host — their private AI and records live there, under their control.
- G Many groups**
The same patient can participate in many groups, each with its own admin and its own policies.
- A Admins, not platforms**
Each group's admin approves members and suggests policies. No company sits in the middle.

Trustee — your first group

The default group for the maia.agropper.xyz host. You will get an invite link.

1

Click the invite link

2

Read the group's policies — shown before you join

3

One click: JOIN

The join landing: the group's policies are visible before you join — captured from the app

A MAIA of your own in about 30 seconds

≈30 sec

from clicking JOIN to chatting

- A private AI, provisioned automatically — no app store, no download
- Chat with your AI right away — records are optional, not required
- Chat with group members — mentors and an Everyone channel are built in

Seconds after JOIN: “Your private AI is ready” — captured from the app

Group policies arrive with you — and they are yours

Joining imports the group’s suggested policies into your own Sharing Policies editor

Your Sharing Policies right after joining — captured from the app

Suggested, not imposed

The group’s defaults are imported as a starting point. Edit or delete any of them.

Opt in as a mentor

Mentors are listed publicly with tags and accept peer messages without prior approval.

Everyone channel

Group-wide messages, on by default — mute it with one switch.

Bring your records when you are ready

An Apple Health export or any health record PDF — dropped straight into the chat

Drop files into the chat

Apple Health exports are detected automatically. Any browser works.

Lists fill in immediately

Categories, medication candidates, encounters, and out-of-range labs — extracted deterministically, before any indexing.

Your choice, every time

MAIA offers the next step; nothing happens without you.

The offer after a file is saved — captured from the app

Index once — typically under 10 minutes

<10 min

one-time indexing, progress shown step by step

- A knowledge base your private AI can search
- Verified Current Medications — you confirm the extracted list
- A Patient Summary and topic indexes
- Every item links back to the source page

The Setup Wizard indexing your records — captured from the app

Verified and cited — down to the page

Nothing is “AI says so”: medications are verified by you; every summary line cites its source page

Lists: medication candidates from Apple Health, ready to VERIFY — captured from the app

Patient Summary with Privacy Filter pseudonyms — every section still cites its source page

Requests meet your Sharing Policies

Group members — and outside visitors — can ask for your information. Your policies decide.

This enables “patients like me” peer support — and managed discovery by potential service providers.

Any chat becomes a deep link

Save a thread, invite a clinician or family member — they see exactly what you shared

Access is by invitation; the link carries the conversation, not your whole record.

Privacy is a feature set, not a promise

Hidden names

Members choose display names; real identity stays with the member. Rename yourself any time.

Mediated messages

Like a dating site: messages flow through the group, no contact details exposed until you choose. Reply privately — or not at all.

Identity levels

Policies can require group-member identity, Doximity-verified clinicians, or stronger — per policy, per purpose.

One MAIA, many groups — and bring your own

Joining another group is one link. Creating one is one button.

- Patients join multiple groups from a single MAIA — one record, one AI, separate policies per group
- A Facebook or other non-MAIA group can create a MAIA group to give its members patient-controlled records and private AI
- Admins write the policies once and export/import them as a policy pack

The admin console: create a group, invite members, manage policies — captured from the app

Your records. Your AI. Your rules.

≈30 sec

to a private AI of your own

<10 min

to an indexed, cited record

Your policies

decide every disclosure
